Figure 2.9
Standard arguments for high-level functions. All four plots are produced by calls to the `plot()` function with the same data, but with different standard plot function arguments specified: the top-left plot makes use of the `lwd` argument to control line thickness; the top-right plot uses the `col` argument to control line color; the bottom-left plot makes use of the `lty` argument to control line type; and the bottom-right plot uses the `ylim` argument to control the scale on the y-axis.
